

AI Analysis Engine — Findings Report

Why don't Blinkit users explore new categories?

Generated from synthesis.json · 2026-08-03 19:40:40 UTC

Use these numbers as the source of truth for slides / Gamma / stakeholder decks.

Corpus	Exploration-relevant	Relevance rate	Top barrier
2,818	643	22.8%	Quality distrust (211)

Executive summary

Across 2,818 multi-source reviews (643 exploration-relevant), users mostly stay in grocery routines or bounce when discovery, quality trust, or price clarity fail. Dominant barriers: dont trust quality for new category, price uncertainty new category, coverage or eta. Category expansion opportunity concentrates in snacks, home, electronics. Recommended next step: run discovery-rail + first-buy guarantee experiments on the top blocked categories.

1. Corpus & exploration signals

Analysis corpus is the preprocessed set (aligned with sentiment / segments / exploration tags).

Source	Rows
play store	2,818

Exploration signal	Count	Share of corpus
want to explore blocked	395	14.0%
stuck in routine	80	2.8%
explored new	2	0.1%
unclear	166	5.9%
noise	2,175	77.2%

User segments (KMeans on feedback)

Segment	Count	Implication for deck
Price Sensitive	1,736	Fee/markup fear blocks trial
Routine Buyers	554	Same milk/bread loop; never browse
Explorers	348	Open to try if trust + clarity
Impulse Buyers	180	Attach if surfaced in-session

2. Barriers ranked (why users avoid new categories)

Rank	Barrier	Mentions	Share	Severity
1	dont trust quality for new category	211	36.0%	high
2	price uncertainty new category	133	22.7%	medium
3	coverage or eta	131	22.4%	medium
4	assortment gap	67	11.4%	medium
5	habit reorder only	36	6.1%	low
6	hard to discover in app	8	1.4%	low

3. Hypotheses × evidence

Evidence mentions = barrier-linked counts from exploration tags (not identity/eval placeholders).

ID	Statement	Linked barrier	Evidence
H1	Users fail to explore new categories because in-app discovery does not surface adjacent categories during grocery sessions.	hard to discover in app	8
H2	Users avoid new categories because quality/authenticity risk feels higher than grocery.	dont trust quality for new category	211
H3	Users hesitate on new categories when all-in price and fees are unclear relative to offline.	price uncertainty new category	133
H4	Power users stay in reorder loops that never expose non-grocery demand.	habit reorder only	36
H5	Exploration intent dies when expected SKUs are missing or out of stock.	assortment gap	67
H6	ETA/coverage anxiety reduces willingness to try unfamiliar categories.	coverage or eta	131

4. Jobs to be done

JTBD 1. When I need something outside my usual grocery list, I want to trust the assortment and quality so I can order without second-guessing.

Situation: Expanding beyond staples into beauty, electronics, home, or pet · Desired: Confidence that the category is as reliable as grocery · Workaround: Order only staples on Blinkit; buy elsewhere for other categories

JTBD 2. When I'm browsing under time pressure, I want new categories to surface in context so I don't have to know what to search.

Situation: Short session, habitual reorder path · Desired: Serendipitous but relevant discovery without leaving the flow · Workaround: Stay on the same SKUs / search only known brands

JTBD 3. When trying a new category for the first time, I want clear price and return signals so the risk feels bounded.

Situation: First purchase in electronics / beauty / pharmacy-adjacent · Desired: Transparent fees, quality cues, easy undo · Workaround: Abandon cart or stick to grocery where risk is known

5. Unmet needs

Priority	Need	Pain	Evidence cue
P0	Visible, trusted paths into non-grocery categories during habitual grocery sessions	Discovery is search-dependent; reorderers never see adjacency	stuck_in_routine=80, discover barrier mentions
P0	Risk reducers (returns, authenticity, freshness) for first buys outside grocery	Quality distrust blocks trial even when assortment exists	dont_trust_quality_for_new_category in barrier ranking
P1	All-in price clarity before commitment on unfamiliar categories	Fee/markup surprise kills exploration mid-funnel	price_uncertainty_new_category ranking
P1	Assortment confidence signals (in stock, alternatives) for expansion categories	Empty or sparse shelves teach users 'Blinkit isn't for this'	assortment_gap + want_to_explore_blocked

6. Category opportunities (ranked)

#	Category	Score	Blocked	Barrier to attack	Suggested experiment	Why now
1	snacks	54	7	hard to discover in app	exp_discover_rail	Adjacent to grocery — easiest expansion wedge.
2	home	52	6	dont trust quality for new category	exp_first_buy_guarantee	Assortment gaps and 'not for Blinkit' mental model.
3	electronics	50	5	dont trust quality for new category	exp_first_buy_guarantee	High intent + high distrust; quality and authenticity cues matter most.
4	pet	46	3	dont trust quality for new category	exp_first_buy_guarantee	Niche but sticky once tried; trust on freshness/expiry.

7. Testable experiments (MVP links)

exp_discover_rail — Category discovery rail after grocery add · Hypothesis H1 · Barrier: hard to discover in app

Intervention: After adding a staple, show a contextual 'also useful tonight' rail from an adjacent category with trust badges.

Primary metric: Attach rate of non-grocery SKU in same session · Guardrail: Checkout completion rate must not drop >2% · Power for 15% relative lift in attach; ~2 weeks on high-traffic cities

exp_first_buy_guarantee — First-buy quality guarantee for new categories · Hypothesis H2 · Barrier: dont trust quality for new category

Intervention: Offer one-tap easy return + quality score for first purchase in beauty/electronics/home.

Primary metric: First-time category conversion among grocery-only cohorts · Guardrail: Return rate spike <3pp vs control · Stratify by city tier; exclude surge-heavy hours

exp_price_clarity — Upfront fee clarity on new-category PDPs · Hypothesis H3 · Barrier: price uncertainty new category

Intervention: Show all-in price (item + fees) and 'vs offline' cue on first-time category PDPs.

Primary metric: PDP→ATC for tagged new-category sessions · Guardrail: No increase in support tickets tagged 'hidden fees' · A/B on electronics + beauty first

exp_break_routine — Routine break prompt for power reorderers · Hypothesis H4 · Barrier: habit reorder only

Intervention: For users with 5+ identical reorder carts, surface one curated 'try something new' pack with free delivery on first try.

Primary metric: Share of sessions with ≥1 new category SKU · Guardrail: Reorder NPS / time-to-checkout · Target stuck_in_routine segment only

8. Deck-ready metrics & finalized product features

North star — % of MACs who purchase from ≥1 new product category each month

Leading (Snacks rail) — Attach rate of non-grocery SKU in same session · rail CTR · PDP→ATC

Leading (Home guarantee) — First-time Home conversion among grocery-only cohorts

Lagging — Category mix per MAC · repeat in new category · expanded basket / AOV · retention / CLV contribution

Guardrails — Checkout completion drop ≤2% (rail) · return-rate spike <3pp (guarantee) · no surge in hidden-fees tickets

Finalized MVP features

- 1) Contextual snacks discovery rail after grocery add (exp_discover_rail)
- 2) Home first-buy quality guarantee + easy return (exp_first_buy_guarantee)
- 3) Trust cues: ratings/comments, all-in price, quality/freshness badge
- 4) Research console: Findings, Opportunities, Validation Desk, Prototype Lab

Recommendation logic (MVP)

Session context (grocery reorder) → category adjacency (snacks first) → barrier-aware treatment (trust/guarantee for high-distrust categories) → inventory availability → price transparency → social proof. Purchase/search/browse

personalization, weather, festivals = roadmap, not MVP-critical.
